

USDE-X WHITE PAPER

Unified Society for the Next Generation Digital Economy

Overview

Unified Society for the Next Generation Digital Economy (USDE-X) is a block chain based network aiming to unite the most innovative cryptocurrencies into one platform allowing users easy access to all features and endless possibilities of the blockchain ecosystem.

We are entering a period of discovery for the average person and cryptocurrency. The mere fact that legislators of multiple countries are crafting laws to regulate the market is a great sign of legitimacy. This is where USDEx comes in. We wanted to create a coin that utilizes a platform to help the average user buy into the crypto market, trade various coins straight across with no need to convert to Bitcoin, and then hold that coin in their own wallet. When a trade is made from one coin to another directly, without having to convert to a common currency or medium, this is a process that is referred to as “atomic swaps”.

The Global Marketplace

As the world becomes smaller with the evolution of digital technology, businesses around the globe are finding more and more potential customers. These business managers and CEOs need to a way to keep up with the ever-changing financial environment of regulatory taxes and legislation, as well as those in other countries.

USDE-X solves these payment issues starting with the US business and branches out to reach a world of interconnected companies. Adoption is slow, but all new ideas are incubated before becoming mainstream. We believe this is partly because of the relatively negative media about crypto-currencies being only for people acting in a nefarious manner. The truth is that legitimate business finances can be greatly improved by the adoption of digital currencies.

We are entering a period of discovery for the average person and cryptocurrency. The mere fact that legislators of multiple countries are crafting laws to regulate the market is a great sign of legitimacy. This is where USDEx comes in. We wanted to create a coin that utilizes a platform to help the average user buy into the crypto market, trade various coins straight across with no need to convert to Bitcoin, and then hold that coin in their own wallet. When a trade is made from one coin to another directly, without having to convert to a common currency or medium, this is a process that is referred to as “atomic swaps”.

Why USDE-X?

With USDEx, we want to help you do more than just trade coins. We want to help you realize the power of communication through blockchain technology. Our vision is to leverage the reach of the numerous coin networks in use right now to help build an interconnected communications system. Imagine being able to send documents and enact smart contracts across networks with one central system. You have a business that uses one crypto while a contractor or firm you want to deal with has another. Now, there is nothing in the way of sending and receiving vital documents and contracts to help move your project along.

We call it “Cross-Chain Technology” and we want this protocol to help reduce the cost of business and personal communications around the world. Less paperwork, more secure. USDEx is the Unified Society for the Next Generation Digital Economy and we want to help you become a part of the new digital economy.

Ultra Fast Transactions

The USDE-x Network Utilizes a faster payment system where transactions are verified within a few seconds rather than hours

Coin Specifications

Algorithm: Script Proof of Stake

120 second block time

3 confirmations per transaction

50 confirmation mined block maturity

232 Million (232,000,000) Total Supply

X-Crypto Project

USDE-x Future plans are to become a massive Community driven currency that utilizes processes such as atomic swaps to unify all cryptocurrencies

X-Crypto Project

Cross-Chain Protocol - Overview

It is very easy to get confused when trying to understand cryptocurrencies and their underlying technologies. Even more so when the average consumer is researching them for investment. From using sophisticated encryption algorithms to understanding how the blockchain advances, one can get frustrated. With USDEX, aim to take a more pragmatic approach. When speaking about the potential uses for blockchain technology and networks, the concept of communications is a novel idea.

How can we use this network to our advantage to send and receive messages, documents and legal papers? The blockchain has been developed to be able to send and receive documents just as one would send and receive USDEX in their wallet. We can also use information from different coin networks, such as Bitcoin, to perform direct swaps of coins between chains, value for value. This is called an “Atomic Swap”. However, what if we combine those features to allow users to send and receive files across different networks? This is where Cross-Chain Technology comes to the forefront.

Your files will pass through the USDE-x network, becoming digitally signed across any additional blockchains of your choosing. With USDE-x, your encrypted transactions result in files being verified and stored forever across multiple blockchain ledgers; adding an uncompromising level of security by allowing other blockchains to store the hash while simultaneously making man-in-the-middle attacks more difficult than ever before. This heightened sense of security will allow us to further polarize USDE-x from the rest of the emerging altcoin market, proving the original spirit of USDE is still with us moving forward after the coinswap. Our mission is to expand on our moral philosophy of a one unified digital world currency. Our team is working on bridging the gaps between altcoin blockchains in the same way USDE-x transactions unite markets across borders. USDE-x plans on ever increasing our investment potential, allowing our clients to mine and stake for a broad range of associated alt coins from within our own robust pool, increasing the potential workload for our clients, ensuring a future in mining for our community, and exponentially increase value with every new associate blockchain we add while moving forward.

USDE-X Roadmap

1. Exchange Platform – Q2 -2018

One of the USDE-X primary objective is to allow people to safely buy USDEx and in order to do that we intend to develop our own exchange platform that would comply with AML and KYC requirements.

2. All-in-one Wallet – Q2 -2018

Instead of developing multiple wallets for windows, mac, android and ios we want to have an all-in-one wallet, fully functional, responsive and available on our website and it will allow you to buy and sell USDEx directly from it without a third party being involved. This will be the first step in implementing atomic swaps

3. Atomic Swaps – Q4 -2018

Atomic swaps, or atomic cross-chain trading, is the exchange of one cryptocurrency to another cryptocurrency, without the need to trust a third-party

4. Cross-Chain Protocol

You will be able to send your file through the USDEx network and it will be transferred to the receiver's network for final delivery. The result is an encrypted file that is stored on the blockchains, secure from prying eyes, and delivered rapidly utilizing the existing atomic swap protocols.
